## ABBREVIATIONS

Name	Description
<b>Ethereum</b>	An open source platform based on blockchain technology to create and distribute smart contracts and decentralized applications.
<b>Ether (ETH)</b>	A cryptocurrency whose blockchain is generated by the Ethereum platform. Ether is used for payment of transactions and computing services in the Ethereum network.
<b>Smart contract</b>	A computer protocol intended to digitally facilitate, verify or enforce the negotiation or performance of a contract.
<b>Solidity</b>	A contract-oriented, high-level language for implementing smart contracts for the Ethereum platform.
<b>Solc</b>	A compiler for Solidity.
<b>ERC20</b>	ERC20 (BEP20 in Binance Smart Chain or xRP20 in other chains) tokens are blockchain-based assets that have value and can be sent and received. The primary difference with the primary coin is that instead of running on their own blockchain, ERC20 tokens are issued on a network that supports smart contracts such as Ethereum or Binance Smart Chain.

## Report for Colend

### Security Audit – Colend Token

Version: 1.0 – Public Report

Date: Oct 30, 2024

---

## EXECUTIVE SUMMARY

This Security Audit Report was prepared by Verichains Lab on Oct 30, 2024. We would like to thank the Colend for trusting Verichains Lab in auditing smart contracts. Delivering high-quality audits is always our top priority.

This audit focused on identifying security flaws in code and the design of the Colend Token. The scope of the audit is limited to the source code files provided to Verichains. Verichains Lab completed the assessment using manual, static, and dynamic analysis techniques.

**During the audit process, the audit team had identified no vulnerable issues in the smart contracts code.**

# 1. MANAGEMENT SUMMARY

## 1.1. About Colend Token

Colend Token reinvigorates a healthy dynamic as the gateway through which users engage with this new financial system. Its goal is to deliver a comprehensive product experience that maintains the advantages of decentralization: non-custodial, transparent, trustless, and resilient.

## 1.2. Audit Scope

This audit focused on identifying security flaws in code and the design of the Colend Token.

It was conducted on commit [63243520410b1a39a591e1ea6c157de67b3988d5](https://github.com/Colend-Protocol/token-geyser/commit/63243520410b1a39a591e1ea6c157de67b3988d5) from git repository <https://github.com/Colend-Protocol/token-geyser>.

## 1.3. Audit Methodology

Our security audit process for smart contract includes two steps:

- Smart contract codes are scanned/tested for commonly known and more specific vulnerabilities using public and RK87, our in-house smart contract security analysis tool.
- Manual audit of the codes for security issues. The contracts are manually analyzed to look for any potential problems.

Following is the list of commonly known vulnerabilities that were considered during the audit of the smart contract:

- Integer Overflow and Underflow
- Timestamp Dependence
- Race Conditions
- Transaction-Ordering Dependence
- DoS with (Unexpected) revert
- DoS with Block Gas Limit
- Gas Usage, Gas Limit and Loops
- Redundant fallback function
- Unsafe type Inference
- Reentrancy
- Explicit visibility of functions state variables (external, internal, private and public)

## Report for Colend

### Security Audit – Colend Token

Version: 1.0 – Public Report

Date: Oct 30, 2024

- Logic Flaws

For vulnerabilities, we categorize the findings into categories as listed in table below, depending on their severity level:

SEVERITY LEVEL	DESCRIPTION
<b>CRITICAL</b>	A vulnerability that can disrupt the contract functioning; creates a critical risk to the contract; required to be fixed immediately.
<b>HIGH</b>	A vulnerability that could affect the desired outcome of executing the contract with high impact; needs to be fixed with high priority.
<b>MEDIUM</b>	A vulnerability that could affect the desired outcome of executing the contract with medium impact in a specific scenario; needs to be fixed.
<b>LOW</b>	An issue that does not have a significant impact, can be considered as less important.

*Table 1. Severity levels*

#### 1.4. Disclaimer

Colend acknowledges that the security services provided by Verichains, are conducted to the best of their professional abilities but cannot guarantee 100% coverage of all security vulnerabilities. Colend understands and accepts that despite rigorous auditing, certain vulnerabilities may remain undetected. Therefore, Colend agrees that Verichains shall not be held responsible or liable, and shall not be charged for any hacking incidents that occur due to security vulnerabilities not identified during the audit process.

#### 1.5. Acceptance Minute

This final report served by Verichains to the Colend will be considered an Acceptance Minute. Within 7 days, if no any further responses or reports is received from the Colend, the final report will be considered fully accepted by the Colend without the signature.

This report contains sensitive information or information that's not meant to be for the general public. These will be censored out as requested by the Colend and will be displayed as

██████████.

## 2. AUDIT RESULT

### 2.1. Overview

The Colend Token was written in **Solidity** language, with the version set to **0.8.17**.

The contract extends **Initializable**, **ERC20Upgradeable**, **ERC20PermitUpgradeable**, **AccessControlUpgradeable**, and **UUPSUpgradeable** from the **OpenZeppelin** library.

```
function initialize(
    string calldata _name,
    string calldata _symbol,
    uint256 _totalSupply,
    address _governance,
    address _receipient
) external initializer {
    UtilLib.checkNonZeroAddress(_governance);
    UtilLib.checkNonZeroAddress(_receipient);
    __ERC20_init(_name, _symbol);
    __ERC20Permit_init(_name);
    __AccessControl_init();
    __UUPSUpgradeable_init();
    _grantRole(DEFAULT_ADMIN_ROLE, msg.sender);
    _grantRole(UPGRADER_ROLE, msg.sender);
    _mint(_receipient, _totalSupply);

    governance = _governance;
}
```

All properties of the Colend Token are set during initialization. Additionally, the Colend Token does not have the **mint()** function, and the entire initial supply is sent to a recipient immediately upon creation.

The contract sets the **DEFAULT\_ADMIN\_ROLE** and **UPGRADER\_ROLE** to deployer. There is also a **governance** role, which is set to deployer at the beginning but can be change to another address with the delay of 3 days.

**Note:** The scope of the audit is limited to the source code files provided. All contracts in the scope are **upgradeable** contracts, the contract owner can change the contract logic at any time in the future.

### 2.2. Findings

During the audit process, the audit team found no vulnerability in the given version of Colend Token.
